

# 1. Goals

Understand what Live / API tests are, why they're useful and how to implement one with rest-assured.

## 2. Lesson Notes

### **Discoverability of the *create* operation**

The *create* API operation will return the URI of the newly created Resource via the *Location* header.

Note that this isn't default Spring behavior and have a look at the *ResourceCreatedDiscoverabilityListener* over on the server side for the details of the implementation.

Also note that we're going to be exploring discoverability a lot more in Module 7 of this course.

**Update:** One quick note about the problem described at minute ~5 of the lesson - it looks like the issue was fixed in newer releases of rest-assured.

## 3. Resources

- rest-assured library

- Testing RESTful Web Services made easy using the REST-assured Framework
