

1. Goals

Learn how to generate a new Access Token using the Refresh Token.

2. Lesson Notes

Check the Access Token

After enabling the check functionality in the Spring Security configuration:

GET http://localhost:8082/um-webapp/oauth/check_token?token={access_token}

Note that, depending on what kind of access you configured for the check endpoint, you may still need the standard Basic Authentication on this request.

Refresh the Access Token

After enabling the refresh token functionality in the Spring Security configuration, and after retrieving the first Access Token (and Refresh Token), we can now:

POST http://localhost:8082/um-webapp/oauth/token?grant_type=refresh_token&refresh_token={refresh_token}
